To Our Customers

This catalogue cancels all previous lists, quotations or prices.

Orders

Order early so that you may get the varieties and grades you prefer. All orders should be written on separate piece of paper and not mixed with body of

Quantities and Prices

The articles in the following list will be furnished at the annexed prices ONLY when the specified amount shall be taken. Fifty, however, will be furnished at the 100 rate and 5 at the 10 rate. In no case does this mean so many trees of assorted classes, but refers to ONE CLASS of assorted varieties; for instance, 5 apples, 5 pears or 5 plums, and NOT to 2 apples, 2 pears and 1 plum.

Substitutions

Where particular varieties are ordered, it should be stated whether and to what extent substitutions will be allowed in case the order cannot be filled to the letter. Where no instructions in this respect accompany the order, we shall feel at liberty to substitute other varieties as nearly similar as possible. If the selection is left entirely to us, we will endeavor to send such sorts as are best suited to your locality.

Packing

All trees and plants are carefully labeled and securely packed in the best manner, for which a moderate charge, sufficient to cover cost of material, will be made.

Express or Freight

Always state which way you want your order shipped and give explicit direc-

tions as to marking packages.

When it is left to us to choose the mode of conveyance, we will exercise our best judgment, but as all articles are at the risk of the purchaser after being shipped. we must not be held responsible for any loss or delay that may occur through the negligence of the transporation companies.

Guarantee, etc.

We warrant all trees and plants to be good, thrifty and true to label, but having no control over them after delivery to the transportation companies, or over the planting and care after they are received by the buyer, we will not be responsible in any other direction than as stated, and accordingly, if any tree or plant should prove untrue to kind, we will either replace same or refund the amount paid; but in no case will we be liable for any sum greater than the amount originally charged, and this statement is due notice to buyers of the extent of our responsibility for trees and plants after delivery and acceptance by the buyers.

Errors and Shortages

Customers are requested to notify us at once of any errors or shortages so that we may rectify it at once. All claims must be made within one week after receipt of shipment, otherwise it will be assumed that the goods are satisfactory and in accordance with the invoice.

References

Orders from unknown correspondents must be accompanied by cash or satisfactory reference.

Hints on Transplanting Deciduous Trees

The situation of the orchard having been decided upon, the ground should be deeply plowed, subsoiled and thoroughly pulverized. The holes should be dug at least a foot larger in every direction than actually required by the roots when spread out in their natural position. Immediately before planting, be sure to examine the roots carefully, and cut away to a smooth surface all bruised, lacerated and broken roots and rootlets with a sharp knife. When the trees are received they should be immediately unpacked and the roots laid in a trench and well covered with soil, which should then be thoroughly wet down. If delayed in transit thereby becoming dry and suffering from exposure —the bark showing signs of shrivelling—it is a good plan to immerse the trees in a tank over night. and the following day bury root and top completely in damp soil for a few days, until they become normal, and may be safely planted out. In planting the top soil should be broken down into the hole and worked carefully in between every root and fiber, filling up every crevice, that every root may be in contact with soil, and the whole made quite firm as the filling up progresses. The tree, when planted, may, in light soils, stand from two to three inches deeper than it did in the nursery; but in heavy clay or wet ground, it is advisable to have itstand at the same height as it was before transplanting. When the hole is nearly filled in, a pail of water should be thrown in to settle and wash in the soil around the roots. The earth should be packed very firmly around the roots as it is disastrous to allow the air to enter.

The ground should be kept loose and free from weeds. It is advantageous to spread around the tree for a distance of two or three feet each way a mulch of rough manure or litter, which conserves the moisture and prevents the ground from drying out and baking.

If the location is subject to high winds, plant with the largest branches towards the prevailing wind, and lean the tree slightly in that direction.

We advise pruning directly after planting. If strong winds prevail, prune with the upper bud pointing against the wind. Unbranched trees should be cut back to 18 to 30 inches if planted in orchard; for dooryard or other situations they may be left taller. Ordinarily about 2-3 of the top should be removed from all branched trees, but this must be done according to the best judgment of the operator as no definite rules can be given, the object being to secure a well balanced head. The leading shoot is usually cut back to secure a good branching form. Unbranched figs, persimmons and walnuts are usually not pruned until the second year. Grapes should be trimmed to one stem and this cut back to 6 inches, except on extra large vines.

Rule—Square Method—Multiply the distance in feet between the rows by the distance the plants are apart in the rows, and the product will be the number of square feet for each plant or hill, which, divided into the number of feet in an acre, (43,560) will give the number of plants or trees to the acre.

Rule—Equilateral Triangle Method—Divide the number required to the acre "square method" by the decimal .866. The result will be the number of plants required to the acre by this method.

About Weights and Shipping

The question of freight charges to distant points is a matter of serious consideration to such customers, and we are therefore submitting a few figures to give a clearer insight into the subject.

The general run of deciduous fruit trees, either in bales or cases, average about as follows: 6 to 8 ft., 2 pounds each; 4 to 6 ft., $1\frac{1}{2}$ pounds each; 3 to 4 ft., 1 pound each; 2 to 3 ft., one-half of a pound each. Grape-vines, one-third of a pound each.

Deciduous ornamental trees from 6 to 8 ft. and up to 12 to 15 ft., 3 to 6 pounds each.

Potted plants in from 3- to 6-inch pots, packed in boxes, weigh from 4 to 12 pounds each.

Citrus trees, balled, packed in boxes, 40 pounds each, and with naked roots, 3 pounds each.

Palms, packed in boxes, with ball of earth, 2- to 3-ft. plants, 40 pounds, and gradually increasing to 110 pounds each on 5- to 6-ft. plants.

Grape cuttings 14 to 16 inches long, 80 pounds to the thousand cuttings, in either bales or boxes.

Eucalyptus, cypress, about 100 to the flat, 50 pounds per flat; hedge plants from 50 to 100 to the box, according to size, 50 pounds per flat.

Stock in cans, pints and quarts, 3 to 5 pounds each, gallon cans 6 to 14 pounds, 5 gallon cans 40 to 65 pounds, 8 to 10 gallon cans 75 to 125 pounds each.

Pioneer Nursery, Monrovia, California.

Hints on Transplanting Deciduous Trees

The situation of the orchard having been decided upon, the ground should be deeply plowed, subsoiled and thoroughly pulverized. The holes should be dug at least a foot larger in every direction than actually required by the roots when spread out in their natural position. Immediately before planting, be sure to examine the roots carefully, and cut away to a smooth surface all bruised, lacerated and broken roots and rootlets with a sharp knife. When the trees are received they should be immediately unpacked and the roots laid in a trench and well covered with soil, which should then be thoroughly wet down. If delayed in transit thereby becoming dry and suffering from exposure —the bark showing signs of shrivelling—it is a good plan to immerse the trees in a tank over night, and the following day bury root and top completely in damp soil for a few days. until they become normal, and may be safely planted out. In planting the top soil should be broken down into the hole and worked carefully in between every root and fiber, filling up every crevice, that every root may be in contact with soil, and the whole made quite firm as the filling up progresses. The tree, when planted, may, in light soils, stand from two to three inches deeper than it did in the nursery; but in heavy clay or wet ground, it is advisable to have itstand at the same height as it was before transplanting. When the hole is nearly filled in, a pail of water should be thrown in to settle and wash in the soil around the roots. The earth should be packed very firmly around the roots as it is disastrous to allow the air to enter.

The ground should be kept loose and free from weeds. It is advantageous to spread around the tree for a distance of two or three feet each way a mulch of rough manure or litter, which conserves the moisture and prevents the ground from drying out and baking.

If the location is subject to high winds, plant with the largest branches towards the prevailing wind, and lean the tree slightly in that direction.

We advise pruning directly after planting. If strong winds prevail, prune with the upper bud pointing against the wind. Unbranched trees should be cut back to 18 to 30 inches if planted in orchard; for dooryard or other situations they may be left taller. Ordinarily about 2-3 of the top should be removed from all branched trees, but this must be done according to the best judgment of the operator as no definite rules can be given, the object being to secure a well balanced head. The leading shoot is usually cut back to secure a good branching form. Unbranched figs, persimmons and walnuts are usually not pruned until the second year. Grapes should be trimmed to one stem and this cut back to 6 inches, except on extra large vines.

Distance.	40 feet apart each way, number plants	27	31
Distance.	50 feet apart each way, number plants	18	20

Rule—Square Method—Multiply the distance in feet between the rows by the distance the plants are apart in the rows, and the product will be the number of square feet for each plant or hill, which, divided into the number of feet in an acre, (43,560) will give the number of plants or trees to the acre.

Rule—Equilateral Triangle Method—Divide the number required to the acre "square method" by the decimal .866. The result will be the number of plants required to the acre by this method.

About Weights and Shipping

The question of freight charges to distant points is a matter of serious consideration to such customers, and we are therefore submitting a few figures to give a clearer insight into the subject.

The general run of deciduous fruit trees, either in bales or cases, average about as follows: 6 to 8 ft., 2 pounds each; 4 to 6 ft., 1½ pounds each; 3 to 4 ft., 1 pound each; 2 to 3 ft., one-half of a pound each. Grape-vines, one-third of a pound each.

Deciduous ornamental trees from 6 to 8 ft. and up to 12 to 15 ft., 3 to 6 pounds each.

Potted plants in from 3- to 6-inch pots, packed in boxes, weigh from 4 to 12 pounds each.

Citrus trees, balled, packed in boxes, 40 pounds each, and with naked roots, 3 pounds each.

Palms, packed in boxes, with ball of earth, 2- to 3-ft. plants, 40 pounds, and gradually increasing to 110 pounds each on 5- to 6-ft. plants.

Grape cuttings 14 to 16 inches long, 80 pounds to the thousand cuttings, in either bales or hoxes.

Eucalyptus, cypress, about 100 to the flat, 50 pounds per flat; hedge plants from 50 to 100 to the box, according to size, 50 pounds per flat.

Stock in cans, pints and quarts, 3 to 5 pounds each, gallon cans 6 to 14 pounds, 5 gallon cans 40 to 65 pounds, 8 to 10 gallon cans 75 to 125 pounds each.

Pioneer Nursery, Monrovia, California.
